\* Asset Under Management \*\* Ranking based on YTD NAV return

**Annotations:**

**Sharpe ratio** is the fund's average return over the risk free rate divided by the standard deviation of the fund. The ratio represents how much additional return an investor has earned relative to per unit of risk of the mutual fund. The metric is calculated based on 52-week data.

**Treynor ratio** is the fund's average return over the risk free rate divided by the beta of the fund. The ratio represents how much additional compensation an investor receives for assuming market risk. The metric is calculated based on 52-week data.

**One Week Excess Return** is the fund's NAV return in the latest week over the contemporaneous weekly return of DSEX.

**YTD (Year to Date) NAV Return** is the fund's NAV return since the beginning of the year to the date of estimation.

**Total YTD (Year to Date) NAV Return** is the sum of fund's NAV return since the beginning of the year to the date of estimation and the dividend declared for the latest audited fiscal year.

**Risk Free Rate** is the average of cut off yields of latest auctioned 91-day, 182-day and 364-day Treasury bills, from which a 7-day treasury rate is estimated. This estimation method is flawed, as the impact of liquidity premium cannot be accounted for.

**Standard Deviation** is a risk measurement of the fund's return volatility. Higher standard deviation is indicative of higher volatility in return and vice versa. The metric is calculated based on 52-week data.

**Beta** is relative risk measurement of the mutual fund's return to the market (benchmark) return. A beta of 1.0 indicates the return of the fund closely mimics the return of the market. A beta of >1.0 indicates the return of the fund is comparatively more sensitive to volatility compared to the market return, and vice versa. Beta is calculated based on 52-week data.

**R-squared** is a correlation metric between the mutual fund return and the market (benchmark) return. High R-squared indicates the return performance of the fund can be attributed to the return performance of the market (benchmark), and vice versa. R-square of >0.7 indicates the return of the fund has high correlation with market return, R-square of 0.4 - 0.7 indicates moderate correlation, and R-square of <0.4 indicates weak correlation. R-squared is calculated based on 52-week data.

**Tracking Error** is volatility metric of excess return relative to market (benchmark) return. A mutual fund with high tracking error and low average return is indicative poor investment performance, and vice versa. The metric is calculated based on 52-week data.

**Information ratio** is the fund's average excess return over the market (benchmark) return divided by the tracking error of the fund. The ratio represents how much excess return the fund has generated on a consistent basis. A high ratio is indicative of superior and consistent performance of the fund manager, and vice versa. The metric is calculated based on 52-week data.

**Alpha** is the excess fund return over the sum of expected return and risk free return. Expected return is the minimum compensation that an investor seeks in order to invest in the fund for a given level of risk. Expected return is derived as beta times the market risk premium. Positive alpha indicates the fund manager is capable of delivering superior risk-adjusted return, and vice versa. Alpha is calculated based on 52-week data.
